	-Vout	-DC Output (for Dual Output)

## Assembling and Installation Method

### Installation

- When two or more power supplies are used side by side, position them with proper intervals to allow enough air ventilation. Ambient temperature around each power supply should not exceed the temperature range shown in “Derating”.
- Avoid placing the DC input line pattern layout underneath the unit. It will increase the line conducted noise. Make sure to leave an ample distance between the line pattern layout and the unit. Also avoid placing the DC output line pattern underneath the unit because it may increase the output noise. Lay out the pattern away from the unit.
- Avoid placing the signal line pattern layout underneath the unit because the power supply might become unstable. Lay out the pattern away from the unit.
- If insulation is required, design the board considering the distance required for insulation between the input and output.
- Avoid pattern wiring in the shaded area, because the surface of the mounting board on which the power supply is mounted may cause insulation failure between input and output.

### Soldering Conditions

- (1) Flow Soldering : 260°C 15 seconds or less
- (2) Soldering Iron : maximum 360°C 5 seconds or less

### Stress to Pin

- Applying excessive stress to the input or output pins of the unit may damage internal connections. Avoid applying stress in excess of that shown in right figure.
- Input/output pins are soldered to the PCB internally. Do not pull or bend a lead powerfully.
- If it is expected that stress is applied to the input/output pins due to vibration or impact, reduce the stress to the pin by taking such measures as fixing the unit to the PCB by silicone rubber, etc.
- Due to prevent failure, unit should not be pulled after soldering with PCB.

Derating

Derating curve for input voltage

MH6

MHFS6, MHFW6 has derating by input voltage is required. shown below.

Ambient temperature derating curve

It is necessary to note thermal fatigue life by power cycle. Please reduce the temperature fluctuation range as much as possible when the up and down of temperature are frequently generated.

In case of forced air, ventilation must keep the temperature of point below the temperatures shown in Instruction Manual 7.
